Revision History

Date	Version	Notes
1 October 2024	1.0	Partially completed version shared with supervisors and TA for feedback.
7 October 2024	1.1	Incorporated feedback and presented during informal presentation with TA.
11 October 2024	1.2	Finished document for PoC submission.
11 November 2024	1.3	Updated document to adhere to 91 .
25 November 2024	1.4	Updated document to adhere to 89
29 December 2024	1.5	Updated document to adhere to 92 , 151 , and 153 .
25 March 2025	1.6	Updated to adhere to 149 , 152 , 154 , and 155 .
26 March 2025	1.7	Updated to reflect new changes to requirements.
4 April 2025	1.8	Replaced all PNG diagrams with PDF versions to adhere to 150 .

1 Symbolic Parameters

Table 1 outlines the symbolic parameters used throughout the document:

Table 1: Symbolic parameters used in requirements

parameter	value	description
USABILITY_THRESHOLD	85%	Minimum percentage of users able to effectively use the system
TIMEOUT_LIMIT	60	Timeout for processes, in seconds
QUERY_TIME_LIMIT	3	Maximum time to retrieve data, in seconds
UI_RESPONSE_TIME	1	Interface response time, in seconds
MAX_LATENCY	2	Maximum latency, in seconds
GRAPH_GEN_TIME	10	Maximum time to generate visualizations, in seconds
PRECISION_LIMIT	4	Minimum number of decimal places
EXPECTED_NUM	300	Expected number of total experiments conducted

2 Purpose of the Project

2.1 User Business

This project aims to aid in the data management and analysis of an ocean alkalinity enhancement experiment process. Rising global temperatures are impacting the pH balance of the oceans, which in turn affects their natural ability to absorb carbon dioxide (CO₂) from the atmosphere. The research is working towards a scalable process to capture CO₂ emissions using Bipolar Membrane Electrodialysis (BMED) technology. This process separates a salt solution into distinct acid and base components, with the base solution meant to be returned to the ocean.

The goal of the experimental study is to increase the ocean's pH levels to enhance its ability to absorb more CO₂, helping to reduce its warming effect

and mitigate global temperature rise. Currently, the production process for generating this base is on a small scale and is still being refined. A significant number of experiments and data collection would be required to scale it up globally, necessitating a more expansive production operation. Optimization of the experimental data is critical to improve process efficiency. This presents a big data software challenge, requiring the ability to identify and fine-tune specific parameters to achieve ideal conditions.

2.2 Goals of the Project

This application will be able to consolidate and organize the data from the experiments with proper labeling across all given datasets, allowing for a centralized method of data storage that is both scalable and maintainable. In the application, users can request to view specific data from the stored datasets given any specified order. Once the data is returned to the user, the application can show inter-parameter comparability to better aid data analysis. This comparability acts as a starting point to analysis and is by no means a final analysis of the data. This will all be presented in a web interface where all the user functions are displayed and can be accessed by those involved in the research study.

3 Stakeholders

3.1 Client

Dr. Charles de Lannoy serves as the main client for this project as he is the lead supervisor of the research study. This solution directly affects his work and is intended to be customized for the problem. Bassel Abdelkader is another client of this project as he is one of the lead researchers that works directly with the experimental data. One of his responsibilities is to manage the data and upload them to their current data storage system, Microsoft Excel.

3.2 Customer

For in-house development, the initial customer is also the client. Dr. de Lannoy is overseeing this project as a client, but he is also one of the end users.

As such, he is considered to be the customer.

Although this project is a tailored solution to one research study, its application can still be extended to any other situation where large sets of data is involved. This could be shared among other researchers to aid in their data management and analysis. Depending on the research team's structure, there could also be different levels of permissions that can be obtained.

3.3 Other Stakeholders

Current student assistants and members of the lab working on the study can also be considered stakeholders for the same reasons as the clients. However, since they may not be working with the data for an extended period of time, they do not serve as a main stakeholder. Funders of the research project may be other stakeholders. However, since they do not work directly with the experimental data, they may not have strong interest in the details of the solution.

3.4 Hands-On Users of the Project

The following is a special type of stakeholder as after this capstone project term, the project will be passed back to the research team to maintain.

- User name/category: Research project team for maintaining this project post capstone
- User Role: Maintain the codebase, adding new features, fixing potential bugs project post capstone
- Subject matter experience: Master knowledge on the goals of the research project. Master knowledge on how the experiment processes work.
- Technical knowledge: Novice knowledge on the technology stack being used in this project: Python, MongoDB, JavaScript, other front-end frameworks.

3.5 Personas

- John Doe is a 23 year old undergraduate student at McMaster who has a research position with the de Lannoy Lab, working on the ocean

alkalinity enhancement experiment. They have been tasked to aid the experiment data collection process. After being told that the data is being stored in a master Excel file; they find that is it hard to use. Being an engineering student without much experience with Excel, they struggle to find the data they want. Inputting data is still a manageable process but they find themselves to be spending a lot of time looking at Excel documentation which they find frustrating as that time could be allocated to being more productive during the school term. Although, they want to a better way to manage the data, they know that it is not up to their decision on what tools are being used but suggested that there could be another better solution to use.

- Dr. Carly Kelvon is a 60 year old professor at a university and has been working on her own research project for over five years. She has gathered lots of data and thankfully she has always been great at Excel. However, over the last two years she has found that Excel is becoming less sustainable. The queries are a lot slower and sifting through hundreds of files is wasting a lot of her time. She sees this more evidently through those that work alongside her as they face the same struggles with even less Excel experience. She wants to find a more scalable solution but she fears that her lack of digital knowledge will do her more harm than good. As a result, she fears that if she introduces a new application to serve her needs better, she will find it harder and more confusing to use.
- Dr. Alex Stark is a 30 year old associate professor who has recently gotten funding for his innovative research idea and has been dedicating all his time on perfecting its methodology. It has only been one year since his research started but had recently found a great application of his ideas to reach far more people and be more impactful that he had originally thought. But with his current data management set-up, he quickly realizes that it is not sustainable. He finds that there are many other solutions in the market but they do not perfectly align with his needs and cost a lot more than what he can spend on a tool. He decided that the best way is to create his own tool but lacks the software knowledge to create something stable and reliable.

3.6 Priorities Assigned to Users

3.6.1 Primary Users

- Dr. Charles de Lannoy
- Bassel Abdelkader
- Student Assistant working on the experiment

3.6.2 Secondary Users

- Researcher with their own research studies
- The founder of the study

3.7 User Participation

Since this project is a personalized solution for a research team, there are no other participants other than the research team and potentially other teams with a similar need.

3.8 Maintenance Users and Service Technicians

N/A

4 Mandated Constraints

The following constraints highlight the restrictions and limitations imposed by the stakeholders, impacting the implementation of the product.

4.1 Solution Constraints

MC-1. The product must accept Comma-Separated Value (CSV) files as input.

- *Rationale:* The lab apparatus generates and stores results as CSV files.
- *Fit Criterion:* The product's input process (the processing and acceptance of input data) into the database shall be approved by testers and developers.

4.2 Implementation Environment of the Current System

MC-2. The product must be able to run on a Windows machine.

- *Rationale:* Currently, the lab has a Windows machine that is used to operate the apparatus and analyse the produced results.
- *Fit Criterion:* The product shall be approved as Windows compliant by testers and developers.

4.3 Off-the-Shelf Software

N/A

4.4 Anticipated Workplace Environment

MC-3. The product shall be used in the Chemical Engineering Lab run by Dr. Charles de Lannoy, Bassel Abdelkader and their team of researchers.

4.5 Partner or Collaborative Applications

N/A

4.6 Schedule Constraints

MC-4. The project must be finished within the course of the current academic year.

- *Rationale:* The finished product, as outlined in the project requirements, must be submitted by the end of the academic year. A few relevant deadlines include:
 - Proof of Concept Demonstration: November 11 to 22, 2024
 - Revision 0 Demonstration: February 3 to 14, 2025
 - Final Demonstration (Revision 1): March 24 to 30, 2025

4.7 Budget Constraints

MC-5. The total cost of the project must not exceed \$750.

- *Rationale:* The product must be economically feasible and all teams must have an equal budget to ensure conformity and equality in terms of access of resources.

4.8 Enterprise Constraints

N/A

5 Naming Conventions and Terminology

The following are standardized terms used throughout the project and its documentation to ensure clarity and consistency in communication.

5.1 Glossary of All Terms, Including Acronyms, Used by Stakeholders Involved in the Project

- **Alkalinity Enhancement:** A process in ocean engineering to increase the ocean's ability to absorb CO₂.
- **Bipolar Membrane Electrodialysis (BMED):** A process that uses electric fields to drive ion movement through membranes, facilitating the generation of the dilute base.
- **CO₂:** Carbon Dioxide, a greenhouse gas that contributes to global warming.
- **Ion Exchange:** The process of exchanging ions between the dilute base and seawater to increase alkalinity.
- **pH Level:** A measure of acidity or alkalinity, critical in assessing the effectiveness of the alkalinity enhancement process.
- **Buffering Capacity:** The ability of seawater to resist changes in pH, essential for maintaining stable conditions during experiments.

- **Oceans' Carbon Cycle:** The natural process by which carbon is exchanged between the ocean, atmosphere, and land, impacting global climate.
- **POC (Proof of Concept):** A demonstration used to verify that a concept is feasible.
- **V&V (Verification and Validation):** Ensures that the software meets the required standards and performs as expected.
- **CSV (Comma-Separated Values):** A file format used for storing tabular data, such as those from experiments.
- **Data Migration:** The process of transferring data between storage types or formats.
- **Backend:** The server side responsible for logic, data management, and API services.
- **Frontend:** The user interface built using React, interacting with the backend.
- **Database:** A structured storage system (MongoDB) used to manage project data.
- **API (Application Programming Interface):** The means by which the frontend communicates with the backend, using GraphQL.
- **CI/CD (Continuous Integration/Continuous Deployment):** Automating testing and deployment to ensure reliable updates.
- **Git:** Distributed version control for tracking code changes and enabling collaborative development.
- **Kanban:** A task management method used in to track progress.
- **Branch:** A separate version of the codebase where changes are developed.
- **Commit:** A recorded change to the codebase.
- **Pull Request:** A request to merge changes into the main codebase after review.

- **Deployment:** Releasing the application to a live environment.

6 Relevant Facts And Assumptions

External factors that may have an effect on the product have been recorded as relevant facts and assumptions in this section.

6.1 Relevant Facts

Currently, two sources of data input are used -

- The CSV files that contain datapoints generated by the apparatus.
- The initial parameter values for each experiment such as power voltage, age of membrane, density module and more that are inputted into template excel files. These values are manually inputted by the user and remain constant throughout each experiment.

6.2 Business Rules

N/A

6.3 Assumptions

N/A

7 The Scope of the Work

This section determines the boundaries of the project to be studied and outlines how it fits into its environment.

7.1 The Current Situation

Currently, a system of Excel template files is used to store and manage the data. CSV files are generated by the lab apparatus, which are then downloaded and copied onto an ‘experiment’ Excel template. This step involves getting rid of redundant data when a single CSV file is split into multiple

Excel files and removing inaccurate data (such as rows of zeroes).

This data in the experiment template is then analyzed and the results from the analysis of each experiment is added to another consolidated Excel template, referred to here as ‘observations’ that records all experiment observations. This observations template also contains additional parameters for each experiment such as membrane, configuration and more which are entered manually by the user.

7.2 The Context of the Work

Figure 1 shows the Work Context Model for the project. The path highlighted with blue arrows indicates the current process and how the existing data will be migrated. The path highlighted with green arrows indicates how the product is expected to work after installation.

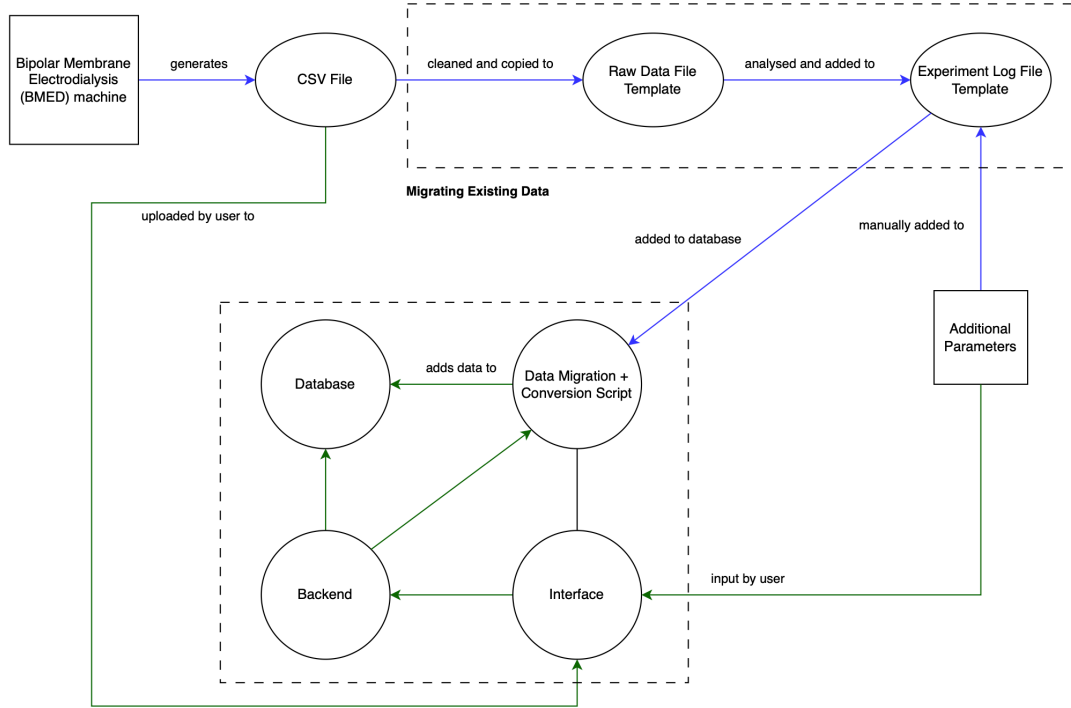

Figure 1: Work Context Model

8 Business Data Model and Data Dictionary

8.1 Business Data Model

Figure 2 represents a business data model that encapsulates all the data that is created, referenced, updated and deleted by processes in the platform.

Observations	
Date	Date and Time
Membrane	String
Configuration	String
Number of Stacks	Integer
Flow Rate (L/H)	Integer
Potential Difference (V)	Integer
Current Limit (A)	Float
NaCl	Float
NaHCO3	Float
NaOH	Float
HCl	Float
Na2SO4	Float
Total	Float

Experiment	
ID Number	Integer
Date and Time	Date and Time
U Cmm	Double
U Stac	Double
I Cmm	Double
D1 Cond	Double
D2 Cond	Double
C1 Cond	Double
C2 Cond	Double
D1 pH	Double
D2 pH	Double
C1 pH	Double
C2 pH	Double
D1 Temp	Float
D2 Temp	Float
C1 Temp	Float
C2 Temp	Float
D2 Flow	Double
C1 Flow	Double
C2 Flow	Double
ELR Flow	Double
DIL1_PWR	Double
CON1_PWR	Double
CON2_PWR	Double
ELR_PWR	Double

9 The Scope of the Product

The following section will highlight use cases of the product and how users and stakeholders will interact with the product.

9.1 Product Boundary

Figure 3 is a use case diagram involving the two clients and major customers. The diagram includes the back-end database as an actor as it interacts with the interface system. Levels 1 to 3 labelled actors are part of the research team mentioned in Section 3.2, where depending on how the team is structured, there are different use cases for different level actors. These are added for clarity of the system.

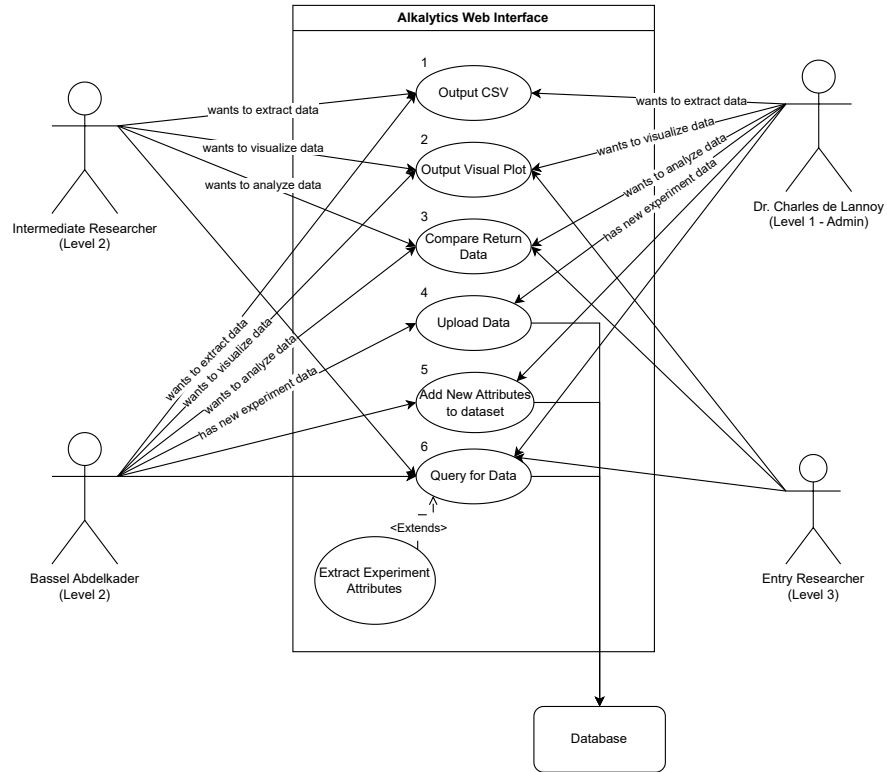

Figure 3: Use Case Diagram

9.2 Product Use Case Table

Table 2 shows a Product Use Case (PUC) table, an extension of the use case diagram shown in Figure 3. The table aims to provide more details.

PUC No.	PUC Name	Actor/s	Input & Output
1	Output CSV	Dr. Charles de Lannoy Bassel Abdelkader Intermediate Researcher	Downloadable CSV file with appropriate data (out) Success or failure message (out)
2	Output Visual Plot	Dr. Charles de Lannoy Bassel Abdelkader Intermediate Researcher Entry Researcher	downloadable portable network graphic (PNG) or portable document format (PDF) file (out) Online viewable plot graphic (out)
3	Compare Return Data	Dr. Charles de Lannoy Bassel Abdelkader Intermediate Researcher Entry Researcher	Online viewable table of result (out) Data analysis results of involved data(out)
4	Upload Data	Dr. Charles de Lannoy Bassel Abdelkader Database	CSV file in expected format and attributes (in) Success or failure user message (out) Update database with inputted data (out)
5	Add New Attributes to Dataset	Dr. Charles de Lannoy Bassel Abdelkader Database	Update database with the new attribute (out) Success or failure user message (out) Attribute name of string type (in)
6	Query for Data	Dr. Charles de Lannoy Bassel Abdelkader Intermediate Researcher Entry Researcher Database	Visual online table with the queried data (out) Selected attribute(s), dates, restrictions (in)

Table 2: Product Use Cases

9.3 Individual Product Use Cases (PUC's)

9.3.1 Output CSV

- Description: The user can export/output the data that they have received from any function on the website system.
- Pre-condition: There must be some data in the database. The information the user wants to output must also be able to be stored in a CSV file.
- Post-condition: The user will get to download the desired CSV file containing data from the database. If the download file has been sent to the system, the user will receive a success or failure message.
- Basic path: After querying the data from the database is successful, the user can click on the download CSV button to export the file onto their system.

9.3.2 Output Visual Plot

- Description: The user is able to generate a graphical plot based on data from the database. The contents of the graph can be customized to include any sort of data that the user decides from the data base. The graph type can be determined by the user.
- Pre-condition: There must be some selected data to be used to plot a graph.
- Post-condition: A online view of the plot will be generated and displayed on the website. There will also be an option for downloadable version.
- Basic path: After querying the database for desired data, the user can pick the option to plot the returned data. The website will then generate a graphical plot based on the returned data.

9.3.3 Compare Return Data

- Description: This use case will allow the user to compare two sets of data such as differences or similarities among other criteria.

- Pre-condition: There must be two sets of data and what attribute(s) are being compared.
- Post-condition: The analysis of the data will be presented in a visual manner. Possible outcome may include colour coded elements or a small statement.
- Basic path: After querying the database for desired data, the user can choose to enable the compare function. The user will then need to pick what attributes they would like to compare and then continue with the website prompts which will eventually give the data analysis result.

9.3.4 Upload Data

- Description: When the user has more experimental data and would like to update the database, this function of the website will be used to take in the data and update/add to the existing database.
- Pre-condition: The file with the new data will be a CSV file and will need to be uploaded through the website interface.
- Post-condition: A success or failure message will be displayed to the user once the file is done uploading and have been added to the database.
- Basic path: The user will need to click on the upload data button and find the file they wish to upload on their system and upload it through the website's drop box.

9.3.5 Add New Attributes to Dataset

- Description: As the experiment and data become larger or changes have been made, there will be times when the dataset will need to be changed by adding new attributes.
- Pre-condition: The user must specify which dataset that they want to edit. The user must then specify what is the attribute name is in the form of a string type input.
- Post-condition: A success or failure message will be displayed to the user once the new attribute has been added to the database.

- Basic path: The user will need to click on the edit dataset button. The user must then fill in the input fields with the correct information

9.3.6 Query for Data

- Description: The user will want to get data from their past experiments. To do so, they will need to decide what they want. This is one of the main use cases for any user/actor.
- Pre-condition: The database must have some data. The user's query request must be filled in through the input fields. The fields can range from dates, to strings, to constraints.
- Post-condition: The returned data will be shown to the user through a visual table representation and will be presented with a range of other functions that the user can do with the returned data.
- Basic path: The user will need to click on the query function button. They will then need to fill in the input fields, go through the user prompts to then get the output.

10 Functional Requirements

This section outlines the key functionalities the application must satisfy with justifications and fit criteria, as well as proposed phase-in dates.

10.1 Data Input Requirements

This section outlines requirements related to data input functionality.

- FR-1.** The application shall allow the user to input new experiment data or parameters.
- *Rationale:* The application needs to be kept up-to-date with on-going experiments, which may include new parameters that did not exist previously.
 - *Fit Criterion:* The user should be able to input new data and parameters without any errors.

- *Priority*: Medium; This is dependent on having FR-2 implemented and can be developed later on.
- *Phase-in Date*: Jan 17.
- *Related Requirements*: FR-2, PR-1, PR-14, SR-3.

FR-2. The application shall store experiment data in the database with all associated parameters and values correctly labelled.

- *Rationale*: Ensures that data retrieval and analysis will be correct and accurate.
- *Fit Criterion*: The application's database parameters and values shall match the original experiment data parameters and values.
- *Priority*: High; This is part of the functionalities that must be implemented for the proof of concept demonstration.
- *Phase-in Date*: Nov 10.
- *Related Requirements*: UHR-3, FR-1, FR-4, FR-5, FR-6, FR-8, FR-10, FR-11, PR-1, PR-6, PR-7, PR-12, PR-13, SR-3.

10.2 Data Migration and Organization Requirements

This section outlines requirements related to data migration functionality.

FR-3. The application shall read existing experiment data stored in .CSV files.

- *Rationale*: Existing experiment data is stored in Excel spreadsheets and must be integrated into the new application for continuity and analysis.
- *Fit Criterion*: The application shall read and import the data files without any errors.
- *Priority*: High; This is part of the functionalities that must be implemented for the proof of concept demonstration.
- *Phase-in Date*: Nov 10.
- *Related Requirements*: PR-12, SR-4, SR-5, SR-6.

FR-4. The application shall organize experiment data by timestamps and experiment ID for unique identification.

- *Rationale*: Each experiment needs to be separately identified for quick retrieval of data and efficiency in search or query actions.
- *Fit Criterion*: Each ID and timestamp shall be traceable to one experiment.
- *Priority*: High; This is part of the functionalities that must be implemented for the proof of concept demonstration.
- *Phase-in Date*: Nov 10.
- *Related Requirements*: FR-2, PR-7, FR-5, FR-6, FR-8, MSR-3, SR-3, SR-4, SR-5, SR-6.

10.3 Data Search and Query Requirements

This section outlines requirements related to viewing and searching for certain data.

FR-5. The application shall allow the user to search for specific datasets based on different parameters.

- *Rationale*: The user must be able to do quick look-ups of certain experiments and their results.
- *Fit Criterion*: The application shall retrieve the correct experiments based on the matching parameters.
- *Priority*: High; This is part of the functionalities that must be implemented for the proof of concept demonstration.
- *Phase-in Date*: Nov 10.
- *Related Requirements*: FR-2, FR-4, PR-6, FR-7, FR-10, PR-2.

FR-6. The application shall allow the user to query two or more parameters or datasets for comparison and analysis.

- *Rationale*: Allows for direct comparisons between different experiment parameters and/or results, which is necessary for data analysis.
- *Fit Criterion*: The application shall retrieve the correct parameters and/or experiments based on the query inputs.

- *Priority*: High; This is one of the first functionalities that must be implemented for the proof of concept demonstration.
- *Phase-in Date*: Nov 10.
- *Related Requirements*: FR-2, FR-4, PR-6, FR-7, FR-10, FR-11, FR-15, PR-2.

FR-7. The application shall display the results of a user's selected search or query in a format that is readable to the user.

- *Rationale*: The user needs to see the results in a format that they can interpret.
- *Fit Criterion*: The results shall be displayed in a table with all labels correct and legible.
- *Priority*: Medium; Its implementation depends on the successful implementation of several other requirements, thus will be properly implemented at a later time.
- *Phase-in Date*: Jan 17.
- *Related Requirements*: FR-5, FR-6, PR-3, PR-10.

10.4 Data Visualization Requirements

This section outlines requirements related to data visualization functionality.

FR-8. The application shall generate visual graphs based on selected parameters and datasets.

- *Rationale*: Visual representation of the data allows for easy interpretation and graphical analysis.
- *Fit Criterion*: The result should display a graphical plot with a title, axes, labels, and a legend.
- *Priority*: Medium; Although this is a core functionality for the application, its implementation depends on the successful implementation of several other requirements, thus will be properly implemented at a later time.
- *Phase-in Date*: Jan 17.

- *Related Requirements:* FR-2, FR-4, FR-9, LFR-4, PR-5, PR-8, PR-10.

FR-9. The application shall allow the user to customize the data visualization by adjusting axes, data ranges, labels, etc.

- *Rationale:* Allows the user to adjust the graphical representation to their needs for their analysis.
- *Fit Criterion:* Modifications to axes, data ranges, labels should be reflected in the generated graph in real-time.
- *Priority:* Low; This depends on the successful implementation of FR-8 and thus will be implemented at a later time.
- *Phase-in Date:* March 21.
- *Related Requirements:* FR-8.

10.5 Data Analysis Requirements

This section outlines requirements related to data analysis functionality.

FR-10. The application shall analyze patterns and trends in the experiment data based on the user's selected parameters.

- *Rationale:* Trend analysis is critical for the user to discover important findings pertaining to the experiment.
- *Fit Criterion:* The application shall generate a result of the analysis to display to the user.
- *Priority:* Medium; Although this is a core functionality for the application, its implementation depends on the successful implementation of many other requirements and thus will be implemented at a later time.
- *Phase-in Date:* Jan 17.
- *Related Requirements:* FR-2, FR-5, FR-6, PR-6, FR-11.

FR-11. The application shall use machine learning algorithms to predict and interpolate the data.

- *Rationale:* Allows for future predictions of data and efficiency when designing future experiments.

- *Fit Criterion*: The application shall generate a report of value predictions or interpolate a graph and provide the interpolated data points.
- *Priority*: Low; This has been identified as a **stretch goal** for the application, thus its implementation will not be considered until all higher priority requirements are satisfied.
- *Phase-in Date*: March 21, if feasible.
- *Related Requirements*: FR-2, FR-6, FR-10, PR-6.

10.6 Error Tracking Requirements

This section outlines requirements for error tracking functionality.

FR-12. The application shall track and log errors in the experiment data.

- *Rationale*: Users need to identify irrelevant or missing parameters.
- *Fit Criterion*: Missing values in the input data should be flagged.
- *Priority*: Low; This has been identified as a **stretch goal** for the application, thus its implementation will not be considered until all higher priority requirements are satisfied.
- *Phase-in Date*: March 21, if feasible.
- *Related Requirements*: FR-13, MSR-3, MSR-5, SR-9.

FR-13. The application shall remove data logged as errors.

- *Rationale*: Ensures data is organized and produces accurate results in analysis.
- *Fit Criterion*: Flagged data should be removed from the database by the algorithm.
- *Priority*: Low; This has been identified as a **stretch goal** for the application, thus its implementation will not be considered until all higher priority requirements are satisfied.
- *Phase-in Date*: March 21, if feasible.
- *Related Requirements*: FR-12, SR-9.

10.7 User Access Management Requirements

This section outlines requirements for user access functionality.

FR-14. The application shall allow the user to sign in with valid credentials.

- *Rationale:* Ensures the data can only be accessed and modified by authorized users.
- *Fit Criterion:* The user shall be able to log in with a username and password.
- *Priority:* Medium; Role-based access control is critical for preventing unauthorized modifications and ensuring the integrity of the associated data, however, it is less integral to the core functionalities of the application compared to that of the data input/migration, search, visualization, and analysis functionalities.
- *Phase-in Date:* Jan 17.
- *Related Requirements:* PR-11, SR-1, SR-2, SR-8, SR-10, SR-11.

10.8 Data Export Requirements

This section outlines requirements for data export functionality.

FR-15. The application shall generate a report of queries in a session for the user to save or download.

- *Rationale:* Allows user to keep a record of their findings for future use or reference.
- *Fit Criterion:* The report should be exported in CSV or PDF format.
- *Priority:* Low; This has been identified as a **stretch goal** for the application, thus its implementation will not be considered until the higher priority requirements are satisfied.
- *Phase-in Date:* March 21, if feasible.
- *Related Requirements:* FR-6.

10.9 Additional Requirements

This section outlines functional requirements that were introduced after the initial completion of this document.

FR-16. The application shall perform calculations using pre-defined formulas over sets, or subsets, of the data.

- *Rationale:* The formulas, developed and used by the end users, are integral to the analysis of the data. There must be functionality to apply these formulas to the data within the application.
- *Fit Criterion:* The application shall display the results of the calculation to the user in a legible format.
- *Priority:* High; The client has prioritized the implementation of this requirement as it is integral to the analysis of the data.
- *Phase-in Date:* March 21.
- *Related Requirements:* N/A.

11 Look and Feel Requirements

This section outlines the look and feel requirements of the web interface for the project, detailing the appearance and the style of the user interface and experience.

11.1 Appearance Requirements

LFR-1. The website should have a simple and organized layout, with clearly defined sections where all major functions should be easily accessible and viewable.

- *Rationale:* Having a simple organized layout will ensure that the navigation of the website is quick and intuitive for accessing features and functions, which will enhance the user experience.
- *Fit Criterion:* A user should be able to identify all the major functions of the website within five minutes of use.

LFR-2. The website shall be responsive on all computer and laptop screens aside from mobile screens.

- *Rationale:* Having a responsive website will ensure that the application accommodates the majority, if not all, of the user base in having a proper user experience.
- *Fit Criterion:* The usability of the website should be the same as the default view on larger and smaller computer, laptop, and monitor screens.

LFR-3. The website's functions and buttons shall be properly labeled so that no button is ambiguous to users.

- *Rationale:* Limiting ambiguity will ensure that users understand and recognize the functions to minimize confusion and improve efficiency.
- *Fit Criterion:* A user should be able to answer questions about the purpose of every button without needing to ask for clarification.

LFR-4. The produced plot from the data shall be properly labeled.

- *Rationale:* Properly labeling plots will help users accurately interpret the data to make important analytical understandings.
- *Fit Criterion:* The plots should not be ambiguous; users should be able to understand what the plot is about within five minutes of viewing it.

11.2 Style Requirements

LFR-5. All icons on the website must be in the design standard.

- *Rationale:* To enforce an identity and unity for the website.
- *Fit Criterion:* After a user's first encounter with the product, 90% of users should see that there is unity among all the icons on the website.

LFR-6. All colours must match the theme of the website.

- *Rationale:* Applying a theme will ensure users have an engaging visual experience.

- *Fit Criterion:* After a user's first encounter with the product, 80% of users should agree that there is a common theme throughout the website.

LFR-7. All fonts are to be consistent throughout the website.

- *Rationale:* Consistent fonts will increase readability, ensuring users can focus on the functionalities that matter on the page rather than inconsistencies.
- *Fit Criterion:* After a user's first encounter with the product, the user should answer that there are 0 fonts that do not belong on the website.

12 Usability and Humanity Requirements

This section outlines the requirements that are intended to make the product usable and ergonomically acceptable to its users.

12.1 Ease of Use Requirements

UHR-1. The product must be easy to navigate and use for *USABILITY THRESHOLD* of individuals with basic computer literacy.

- *Rationale:* The product must be user-friendly. In the context of this project, basic computer literacy is defined to encompass five computer skills - using a keyboard to type, using a mouse to navigate, understanding basic software applications such as word processing and spreadsheets, browsing the internet, and managing files and folders.
- *Fit Criterion:* An individual with basic computer literacy, such as John Doe as described in [Personas](#) must be able to launch the application and upload an input file without any assistance from the administrator.

12.2 Personalization and Internationalization Requirements

UHR-2. The current version of the product will only be available in English (EN-US) and more languages can be added in the later versions.

- *Rationale:* Currently, the product is only expected to be used by McMaster faculty and staff who are fluent in English.

UHR-3. The product must recognize commonly used scientific and mathematical symbols.

- *Rationale:* The product shall be used to store scientific parameters as datapoints so the product must be able to recognize commonly used symbols used to specify scientific properties.
- *Fit Criterion:* The product must be able to recognize the uppercase and lowercase Greek Alphabet.

12.3 Learning Requirements

UHR-4. At least *USABILITY_THRESHOLD* of users must be able to use the product without any formal training and with minimal guidance.

- *Rationale:* The product shall be intuitive to use. Users must be able to freely navigate and experiment with the product after a simple product walkthrough.
- *Fit Criterion:* A new user with basic computer literacy skills should be able to upload an input file, enter initial experiment parameters, select fields to be compared and view their graph after a simple product walkthrough by the administrator.

12.4 Understandability and Politeness Requirements

UHR-5. The product shall maintain consistent use of terminology across the platform to avoid confusion.

- *Rationale:* As an example, if the term "parameters" has been used in one part of the interface, it will not be used interchangeably with "variables" in a different part of the interface.
- *Fit Criterion:* A thorough visual inspection conducted by testers should not reveal any discrepancies.

12.5 Accessibility Requirements

UHR-6. The web interface of the product must be fully compliant with the Web Content Accessibility Guidelines (WCAG) 2.1 standards at Level AA.

- *Rationale:* WCAG 2.1, Level AA compliance is an internationally accepted, common standard for making web content more accessible.
- *Fit Criterion:* Compliance with the standard will be tested by testers and measured using the Level AA compliance checklist.

13 Performance Requirements

Performance requirements define the measurable standards the application must meet regarding speed, accuracy, robustness, and resource usage to ensure optimal performance of the application's functions.

13.1 Speed and Latency Requirements

PR-1. The application shall store new data or parameters within *TIMEOUT_LIMIT* seconds of input.

- *Rationale:* The speed at which the task can be completed depends on the size of the new data to be inputted or how the addition of a new parameter will affect the existing database structure. The quantified timeframe allows for adequate processing time that aligns with user expectations.
- *Related Requirements:* FR-1, FR-2.

PR-2. The application shall take a maximum of *QUERY_TIME_LIMIT* seconds to retrieve data from the database for search and query requests.

- *Rationale:* The speed at which the task can be completed varies based on internet connectivity and the complexity of the query being executed.
- *Related Requirements:* FR-5, FR-6.

PR-3. The interaction between the interface and the user shall have an average response time of *UI_RESPONSE_TIME* seconds under stable internet connection.

- *Rationale:* Ensures a fluid interaction between the user and the application.
- *Related Requirements:* FR-7.

PR-4. The application shall have a maximum latency of *MAX_LATENCY* seconds for search and query actions.

- *Rationale:* Ensures that the delay between a user's request and the application's response is minimized to provide the user with quick feedback and a smoother user experience.

PR-5. The application shall generate visualizations of data in an average time of *GRAPH_GEN_TIME* seconds, depending on the size of the dataset being processed.

- *Rationale:* The time required to render a graph will be affected by the number of datapoints included in the plot. Larger datasets will take longer to process and display.
- *Related Requirements:* FR-8.
- *Fit Criteria for PR-1 to PR-5:* The application shall satisfy the requirements above.

13.2 Safety-Critical Requirements

N/A; the application does not have safety-critical requirements to consider.

13.3 Precision or Accuracy Requirements

PR-6. All parameter values shall be accurate to at least *PRECISION_LIMIT* decimal places.

- *Related Requirements:* FR-2, FR-5, FR-6, FR-10, FR-11.

PR-7. All timestamps of experiment data shall be accurate to milliseconds.

- *Related Requirements:* FR-2, FR-4.

PR-8. Values on visual data plots shall be accurate to at least *PRECISION_LIMIT* decimal places.

- *Related Requirements:* FR-8.
- *Rationales for PR-6 to PR-8:* Accuracy of the data is critical for data analysis, prediction, and interpolation.
- *Fit Criteria for PR-6 to PR-8:* The application shall satisfy the requirements above.

13.4 Robustness or Fault-Tolerance Requirements

PR-9. The application shall not crash but display an error message if it loses connection to the backend server.

PR-10. The application shall not terminate but allow the user to view previously loaded queries and generated plots if it loses connection to the internet.

- *Rationales for PR-9 and PR-10:* The application should not fail or crash when experiencing unexpected circumstances.
- *Related Requirements:* FR-7, FR-8.

13.5 Capacity Requirements

PR-11. The application shall allow for up to three simultaneous users.

- *Rationale:* The number of anticipated end-users is currently three.
- *Related Requirements:* FR-14.

PR-12. The application shall be capable of storing data for up to *EXPECTED_NUM* experiments.

- *Rationale:* The application must be capable of storing and processing large amounts of data.
- *Related Requirements:* FR-2, FR-3, PR-13.
- *Fit Criteria for PR-11 and PR-12:* The application shall satisfy the requirements above.

13.6 Scalability or Extensibility Requirements

PR-13. The application shall be able to process and store the existing data. The amount of data going into the application is expected to grow until the experiment study comes to an end.

- *Related Requirements:* FR-2, PR-12, PR-15.

PR-14. The application shall be able to add additional parameters that did not previously exist in the database at the discretion of the user.

- *Related Requirements:* FR-1, PR-15.
- *Rationales for PR-13 and PR-14:* The application must be able to expand to keep up with future experiments.

13.7 Longevity Requirements

PR-15. The application shall operate for the duration of the experiment study.

- *Related Requirements:* PR-13, PR-14.

14 Operational and Environmental Requirements

Operational requirements outline the conditions in which the application is expected to operate, which includes system compatibility and distribution requirements.

14.1 Expected Physical Environment

OER-1. The application shall operate in a typical lab environment with reliable internet connectivity.

- *Rationale:* Ensures functionality in environments where end-users are most likely to use the application.
- *Related Requirements:* MC-1

14.2 Wider Environment Requirements

OER-2. The application shall be compatible with desktop environments running Windows.

- *Rationale:* Ensures functionality in the technological environment the product is expected to run on.
- *Fit Criterion:* Testing will be conducted on the latest version of the Windows operating system to verify that the application runs without issues.
- *Related Requirements:* MC-2

14.3 Requirements for Interfacing with Adjacent Systems

OER-3. The application shall operate on the most recent versions of Chromium-based web browsers.

- *Rationale:* The application should be compatible with Chromium-based web browsers to ensure broad availability and smooth operation on widely-used platforms by the end-users.
- *Fit Criterion:* Performance testing shall be conducted on the latest version of Google Chrome to verify the application loads within 5 seconds and functions without crashes or errors.

14.4 Productization Requirements

OER-4. The application shall be distributed as a web application.

- *Rationale:* Ensures easy access and usability for the end-users who do not have enough experience in database management.

OER-5. The application shall provide an onboarding process with user documentation that enables new users to navigate the interface and complete basic tasks.

- *Rationale:* Ensures that users can use the application without needing frequent external support.

- *Fit Criterion:* Usability testing shall verify that at least 85% of test users are able to perform key tasks within 10 minutes following the user documentation.

14.5 Release Requirements

OER-6. The first version of the application shall be released after project completion.

- *Related Requirements:* MC-4.

15 Maintainability and Support Requirements

Maintenance requirements encompass the strategies and processes needed to ensure a system remains functional, efficient, and up-to-date throughout its lifecycle.

15.1 Maintenance Requirements

MSR-1. The application's maintenance must be the responsibility of the development team with no involvement from the users.

- *Rationale:* Ensures that skilled personnel handle maintenance.
- *Fit Criterion:* All maintenance tasks must be logged, with no direct user intervention recorded.

MSR-2. Documentation must be provided for future maintenance and to enable seamless knowledge transfer to new teams.

- *Rationale:* Ensures smooth onboarding and continuity in development.
- *Fit Criterion:* The documentation must be updated with every major release and must be reviewed semi-annually.
- *Related Requirements:* MSR-3.

MSR-3. The application must be designed to accommodate future development, including the addition of new experimental parameters or features without backwards progression.

- *Rationale:* Ensures the application can scale and evolve without compromising existing features.
- *Fit Criterion:* At least 95% of modifications should not require changes to core functionalities.
- *Related Requirements:* FR-4, FR-12, MSR-2.

15.2 Supportability Requirements

MSR-4. The application must have an intuitive user interface that allows users to operate it independently without requiring external assistance.

- *Rationale:* Ensures a user-friendly experience that reduces the need for help desk support.
- *Fit Criterion:* At least 85% of users in a usability test must be able to complete core tasks without external assistance.
- *Related Requirements:* LF-1, LF-2, LF-3, UHR-1, UHR-4.

MSR-5. The application must have automated guidance, such as error messages, to assist users in troubleshooting common issues.

- *Rationale:* Ensures users can resolve issues on their own, reducing the volume of support requests.
- *Fit Criterion:* At least 80% of users should be able to resolve common errors without external support.
- *Related Requirements:* FR-12.

15.3 Adaptability Requirements

MSR-6. The application must be compatible with modern web browsers to ensure widespread accessibility.

- *Rationale:* Ensures the application is accessible to a broad range of users and devices.
- *Fit Criterion:* The application must run without major functionality issues on the latest stable versions of Chrome, Firefox, Edge, and Safari.
- *Related Requirements:* LF-1, LF-2.

16 Security Requirements

Security requirements focus on protecting data, controlling access, ensuring integrity, enforcing privacy standards, and auditing user actions within the application.

16.1 Access Requirements

SR-1. Access to the application must be restricted to authorized personnel, with an authentication mechanism.

- *Rationale:* Ensures that only authorized users can interact with the application.
- *Fit Criterion:* 100% of login attempts must require valid credentials, with at most 0.5% authentication failures due to system errors.
- *Related Requirements:* FR-14, SR-2, SR-8, SR-10.

SR-2. Only authenticated users should have the ability to query or modify the data, and each user's access must be limited to their role-based permissions within the application.

- *Rationale:* Ensures users can only perform actions that align with their roles.
- *Fit Criterion:* 100% of unauthorized actions must be blocked, with role-based access verified in at least 95% of test cases.
- *Related Requirements:* FR-14, SR-1, SR-8.

16.2 Integrity Requirements

SR-3. The application must validate data inputs to ensure they conform to expected formats and values before processing.

- *Rationale:* Ensures only valid data is processed, reducing errors.
- *Fit Criterion:* 100% of invalid data entries should be detected and rejected before processing.
- *Related Requirements:* FR-1, FR-2, FR-4.

SR-4. The application must not modify the data unnecessarily during its transfer process.

- *Rationale:* Ensures the original data remains accurate and unaltered.
- *Fit Criterion:* Data integrity should be maintained in 100% of transfer tests, with logs confirming accuracy.
- *Related Requirements:* FR-3, FR-4, SR-5, SR-6.

SR-5. The application must ensure that any data processed or transferred is free from duplication or inconsistencies.

- *Rationale:* Ensures data consistency and prevents corruption.
- *Fit Criterion:* At least 100% of duplicated records should be detected and prevented.
- *Related Requirements:* FR-3, FR-4, SR-4, SR-6.

SR-6. The application must have safeguards in place to maintain the accuracy of the transferred data.

- *Rationale:* Ensures reliable data transfer without loss or error.
- *Fit Criterion:* Transfer operations should maintain 100% data accuracy, verified through checksum validation.
- *Related Requirements:* FR-3, FR-4, SR-4, SR-5.

16.3 Privacy and Compliance Requirements

SR-7. All personal or research-related data must be handled in compliance with relevant privacy laws and standards, such as GDPR, HIPAA, or institutional policies.

- *Rationale:* Ensures legal compliance and protection of sensitive data.
- *Fit Criterion:* At least 100% of personal or research data must be stored in an encrypted format, and access must be logged.
- *Related Requirements:* SR-8, SR-9.

SR-8. The application must restrict data sharing with external parties unless explicitly authorized and compliant with privacy regulations.

- *Rationale:* Ensures transparency and control over data sharing.
- *Fit Criterion:* Data-sharing logs must show that at least 99% of external data transfers followed approved authorization processes.
- *Related Requirements:* FR-14, SR-1, SR-2, SR-7.

SR-9. Users must be informed of data collection, storage, and usage policies through an explicit consent mechanism.

- *Rationale:* Ensures compliance with transparency regulations.
- *Fit Criterion:* 100% of users must explicitly agree to data collection policies before using the application.
- *Related Requirements:* SR-7, SR-8.

16.4 Audit Requirements

SR-10. The application must maintain a comprehensive audit trail, logging all access and modification events, including timestamps and identities of users performing actions.

- *Rationale:* Ensures accountability and traceability of actions.
- *Fit Criterion:* At least 80% of access and modification events must be recorded in the audit logs.
- *Related Requirements:* FR-12, FR-13.

SR-11. Audit logs must be securely stored and accessible only by authorized personnel.

- *Rationale:* Ensures the security and integrity of audit data.
- *Fit Criterion:* 100% of logs must be encrypted and access restricted to users with administrative privileges.
- *Related Requirements:* FR-14, SR-1.

16.5 Immunity Requirements

SR-12. The application must have proactive measures to detect and mitigate suspicious activities, such as repeated unauthorized access attempts, ensuring the application remains secure at all times.

- *Rationale:* Ensures early detection and prevention of security breaches.
- *Fit Criterion:* The system must detect and block at least 95% of unauthorized login attempts after three failed tries, with alerts sent to administrators.
- *Related Requirements:* FR-14.

17 Cultural Requirements

CR-1. The product must not be biased towards certain geographic regions or countries and their societal norms.

- *Rationale:* In scientific fields, different countries use distinct systems of units with the two most common systems being the metric system and the imperial system. The product must support multiple systems of units and allow users to switch between them easily.

18 Compliance Requirements

N/A as no relevant standard compliance and legal requirements could be identified.

19 Open Issues

N/A

20 Off-the-Shelf Solutions

Off-the-shelf solutions are evaluated to explore whether existing products can meet the project's needs or if custom development is required. By comparing

available options, the team can determine which aspects of these products satisfy the project's requirements while also identifying their limitations.

20.1 Ready-Made Products

Products that could meet most or all of the project's requirements without significant customization:

- **Microsoft Power BI:** A business analytics tool capable of handling large datasets, offering data import from CSV files and advanced visualizations.
 - **Key Features:**
 - * Supports CSV imports and data querying.
 - * Scalable data handling.
 - * Generates dynamic visualizations.
 - **Limitations:**
 - * High-cost licensing for continuous use.
 - * Real-time CSV data updates might be challenging to implement.
 - * Lacks flexibility for scientific applications, especially niche inter-parameter comparability.
- **Tableau:** A data visualization tool known for creating interactive dashboards from large datasets.
 - **Key Features:**
 - * Powerful querying.
 - * Generates dynamic visualizations.
 - * Interactive dashboards with advanced analytics.
 - **Limitations:**
 - * High-cost licensing for continuous use.
 - * Lacks support for scientific-specific customization.
 - * Not designed for handling algorithmic data comparisons or extending to new experimental parameters.

20.2 Reusable Components

Products that could be used by the project.

- **D3.js:** A JavaScript library for creating dynamic, interactive visualizations.
 - **Key Features:**
 - * Highly customizable for complex data visualizations.
 - * Integrates with web technologies (e.g., React).
- **Plotly.js:** A JavaScript library for building interactive plots and graphs in web applications.
 - **Key Features:**
 - * Customizable graphs and charts for web interfaces.
 - * Supports real-time updates.

20.3 Products That Can Be Copied

N/A; no product exists that fits all the requirements out-of-the-box.

21 New Problems

This section outlines potential problems the new application may introduce into the environment in which it will be deployed.

21.1 Effects on the Current Environment

The application is expected to be compatible with the current implementation environment. There should be no adverse effects that come from the new application.

21.2 Effects on the Installed Systems

N/A; There should be no conflicts with existing systems.

21.3 Potential User Problems

N/A; There are no anticipated user problems.

21.4 Limitations in the Anticipated Implementation Environment That May Inhibit the New Product

The reliance on stable internet connection may pose limitations on product access and functionality. Additionally, the server must have sufficient resources allocated to handle the anticipated volume of data and data processing demands.

21.5 Follow-Up Problems

Scalability may become a concern if data volume grows larger than anticipated, which will require monitoring and adjustments to ensure optimal performance.

22 Tasks

The team will follow an effective task management plan that emphasizes structure, iterative progress, milestone tracking, and accountability for successful project outcomes.

22.1 Project Planning

The team will adopt an agile lifecycle approach, focusing on iterative progress and adaptability. Work will be organized into stages, milestones, and phases, with regular reviews and adjustments to ensure alignment with goals. Issues are managed via GitHub and all communications are documented to ensure accountability. Stakeholder feedback will be integrated throughout the process to ensure the solution meets evolving requirements.

In addition, project planning will include weekly team meetings, biweekly supervisor meetings. Deliverables are categorized into stages where roles are rotated among team members to share responsibility.

22.2 Planning of the Milestones

The milestones provide a structured approach to the project’s documentation, planning, and demonstration activities. By the deadlines, the team is expected to complete and review the documents to ensure accuracy, compliance with project requirements, and readiness for subsequent stages. Table 3 outlines these details.

Stage	Milestone	Deadline
Stage 1	Problem Statement, POC Plan, Development Plan Requirements Document Revision 0	Sept 24 Oct 9
Stage 2	Hazard Analysis V&V Plan Revision 0	Oct 23 Nov 1
Stage 3	POC Demonstration	Nov 11 - 22
Stage 4	Design Document Revision 0	Jan 15
Stage 5	Revision 0 Demonstration	Feb 3 - 14
Stage 6	V&V Report Revision 0	Mar 7
Stage 7	Final Demonstration (Revision 1) EXPO Demonstration Final Documentation (Revision 1)	Mar 24 - 30 Apr TBD Apr 2

Table 3: Project Decomposition and Deadlines

22.3 Planning of the Development Phases

Table 4 shows the development phases, outlining the progression of the project’s coding and implementation efforts. Each phase is focused on achieving significant technical progress that works alongside the milestones to allow for incremental progress and continuous refinement.

Stage	Milestone	Deadline
Phase 1	Backend Database Development	Nov 1
	Data Migration Algorithm	Nov 8
	POC Functional Testing	Nov 10
	POC Demonstration	Nov 11
Phase 2	Backend Refinement & Bug Fixes	Dec 6
	Basic Frontend Development	Jan 3
	Frontend-Backend Integration	Jan 17
	Preliminary Testing & Bug Resolution	Jan 24
	Revision 0 Demonstration	Feb 3
Phase 3	Final Frontend Features Development	Feb 14
	Backend Optimization	Feb 21
	Full System Testing & Debugging	March 21
	Revision 1 Final Demonstration	March 24

Table 4: Project Development Phases and Deadlines

Phase 1 focuses on the Proof of Concept (POC), where the team is expected to develop and present a functional prototype that demonstrates the core features and feasibility of the project. This phase focuses on the backend, including building a database capable of querying and sorting data, and implementing an algorithm to transfer data from a CSV file into the database format.

Phase 2 involves the Revision 0 Demonstration, where the backend is expected to be fully completed according to the project requirements. In addition, a basic frontend will be developed and integrated into a website to allow interaction with the backend functionality. It is expected that some bugs or issues will be displayed.

Phase 3 Phase 3 is the Revision 1 Final Demonstration, where the final version of the project is presented. During this phase, final frontend features will be developed to improve the user interface. The backend will be optimized for performance. Full system testing and debugging will address any outstanding issues. This phase represents the culmination of all development efforts, with a fully functioning product that meets all requirements. Ultimately, it highlights the project’s readiness for production.

23 Migration to the New Product

This section includes a list of conversion activities that are necessary that are necessary for the project planning process and outlines a rough timeline for their implementation.

23.1 Requirements for Migration to the New Product

The following conversion tasks have been identified as a part of the project planning process.

23.1.1 Use of Phased Implementation

The system will not be implemented in phases and would be installed as a part of a single process after testing and approval. This would be done following Stage 7 described in table 3 and Phase 3.

23.1.2 Data Conversion

Currently, the files are stored in CSV format. In order to make them compatible for migration to the new database, the files must be converted into the appropriate format, likely, JavaScript Object Notation (JSON) format. This means that a special program must be written to transport the data as the new system will only accept JSON files. The goal is, when a file is inputted to the new system (in CSV format), the program will convert it to JSON so that the data can be entered into the database.

23.1.3 Major Components

The product has been decomposed into the following major components that will be put in place based on this timeline -

- Database with migrated data and functionality to compare parameters by the Proof of Concept Demonstration
- Interface that allows inputting data and adding new parameters by the end of December 2024
- Dashboard that allows analysis of data and visualizing graphs by the end of January 2025

23.1.4 Decomissioning the Old Product

Based on conversations with primary stakeholders, it has been determined that there is no need to run the new product in parallel with the existing product. After the database is set-up by Stage 3 as outlined in table 3, all existing data up until that point will be migrated to the new database. The old product will be used to record data from continued experiments which will be migrated to the new database at the end of each month post Stage 3 and up until Stage 7.

Since the old product is just a collection of spreadsheets, no special effort is needed to decomission them. A visual inspection and testing will be performed by testers and stakeholders each time the data is migrated to the new product to ensure its accuracy and integrity.

23.2 Data That Has to be Modified or Translated for the New System

The following section outlines whether, and how, the data that is currently in use will be modified or translated for the new system.

23.2.1 Current Technology

Currently the data is retrieved in the form of CSV files and copied onto existing Excel templates that are used to clean, sort and analyze the data. Although the templates are sophisticated and well-designed, a lot of manual work is involved to flag incorrect data (rows of zeroes for all parameters), remove redundant data (the data file is sometimes split into multiple CSV files that might contain some overlapping data) and more.

Some of the collected parametric data is also inaccurate (such as the power voltage and density module) and so those columns of data are ignored. To compare different experiments, the user is required to switch between experiment files to view their respective graphs. This is cumbersome and as the number of experiments increase, unsustainable in the long-term.

23.2.2 Data Translation

A script will be written to automate the translation of files from CSV to JSON format. This has been described in detail in the [Data Conversion](#) section.

24 Costs

N/A

25 User Documentation Requirements

User documentation will cover the more complicated features and functionalities of the website.

This documentation will include how to add new attributes to the dataset, how to request data plots and any major functionality features.

This document is intended to be a help/tutorial for the end users who will be using the site for its functionalities. Its target is for those who have limited software knowledge. Although most functions aims to be as intuitive as possible to the user, since this is an analysis application there should be documentation explaining for those who have no idea about how research data works and how to interact with it using the website.

25.1 Training Requirements

No training is required to use the end product.

26 Waiting Room

The following requirements are beyond the sophistication of, or time allowed for, initial release of the product.

26.1 Automatically Download Data from Lab Apparatus

WR-1.: The product shall automatically download the CSV data files from the lab apparatus and after conversion, upload them to the database.

- *Rationale:* Currently, the data has to be manually exported from the machine at the end of every week to ensure that the data does not get lost or overwritten.
- *Expected Version:* Version 2

26.2 Dynamic Dashboard to Generate Data Reports

WR-2.: The product shall include a dashboard that hosts multiple visual plots that are dynamically updated based on changes in the data.

- *Rationale:* For the initial release, only basic plots that are already being used by the user will be available for viewing. Whenever data is modified, the graph must be regenerated to view the updated plot.
- *Expected Version:* Version 2

26.3 Machine Learning Analysis and Projections

WR-3.: The product shall use machine learning algorithms to automatically compare parameters and generate visual graphs based on simple text prompts.

- *Rationale:* The idea is to use artificial intelligence to suggest parametric comparisons or visual graphs that the user might not have thought of. The aim is to explore analyses that might not have been considered by a user.
- *Expected Version:* Version 3

26.4 Mobile Development

WR-4.: The product shall have a mobile version.

- *Rationale*: The project can be extended to include a mobile application version of the product to increase accessibility and reachability.
- *Expected Version*: Version 4

27 Ideas for Solution

- Use a NoSQL database such as MongoDB instead of a SQL database.
- Use JavaScript to implement the interface.

28 Appendix A — Traceability

This section was added to the Volere template to provide a traceability table, shown in table 5, for the functional and non-functional requirements.

Requirement ID	Dependent on	Traced from
FR-1	FR-2	PR-1, PR-14, SR-3
FR-2	UHR-3	FR-1, FR-4, FR-5, FR-6, FR-8, FR-10, FR-11, PR-1, PR-6, PR-7, PR-12, PR-13, SR-3
FR-3	N/A	PR-12, SR-4, SR-5, SR-6
FR-4	FR-2, PR-7	FR-5, FR-6, FR-8, MSR-3, SR-3, SR-4, SR-5, SR-6
FR-5	FR-2, FR-4, PR-6	FR-7, FR-10, PR-2
FR-6	FR-2, FR-4, PR-6	FR-7, FR-10, FR-11, FR-15, PR-2
FR-7	FR-5, FR-6	PR-3, PR-10

SR-11	FR-14	N/A

Table 5: Traceability table of the requirements.

29 Appendix B — Reflection

1. What went well while writing this deliverable?

Writing this deliverable gave us greater clarity regarding the project and made us think of questions we hadn't considered before such as what our data migration plan would look like, if we need RBAC (Role Based Access Control) and what each role and security level should include and more.

Additionally, we had already acquired significant knowledge about our supervisors' needs/expectations for the project before we began the writing process, which gave us a clearer guide on modelling our requirements and allowed us to start earlier rather than later. As a result, we were able to develop an initial draft, which they reviewed and provided feedback on, enabling us to refine our document in an iterative manner.

2. What pain points did you experience during this deliverable, and how did you resolve them?

The major pain point for this deliverable was the length and the amount of content that had to be condensed into a single document in such a short span of time. With deadline for other courses, coordinating with supervisors and giving them enough time to review our SRS for feedback - most of the steps felt rushed. Since the Volere template is so detailed, we also ran into multiple issues where we either did not know what a section or sub-section was asking for or figuring out what to write for a non-relevant section that is included in the rubric.

However, we were able to address our questions and concerns through a meeting that we had scheduled with our TA, on top of the informal review session. This helped us gain a better understanding of the expectations for each section we faced difficulties with.

3. How many of your requirements were inspired by speaking to you client(s) or proxies (e.g. your peers, stakeholders, potential users)?

Most of our FRs were inspired by our client, primarily our supervisors. Since they do not have a concrete plan for how they want this project implemented and instead have an abstract idea of what they would want to see in the product, it gave us a lot more room to be creative and consider multiple scenarios for our requirements, ultimately choosing the ones that suit our project the best. Most of the NFRs had to be brainstormed by our team and then validated by the stakeholders since they hadn't given much thought to these aspects of the product.

4. Which of the courses you have taken, or are currently taking, will help your team be successful with your capstone project?

3RA3 or Software Engineering Requirements was very helpful in writing up the SRS because we weren't completely clueless and did not have to spend a lot of time researching what an SRS is or what requirements are. This meant we could dive straight into work. Another course that has been helpful is 3DB3 or Databases mostly because after taking that course, we've had experience dealing with relational databases and were able to determine very early on how a relational database would not be the most suitable for our project and thus, pivot towards NoSQL databases.

5. What knowledge and skills will the team collectively need to acquire to successfully complete this capstone project? Examples of possible knowledge to acquire include domain specific knowledge from the domain of your application, or software engineering knowledge, mechatronics knowledge or computer science knowledge. Skills may be related to technology, or writing, or presentation, or team management, etc. You should look to identify at least one item for each team member.

This question was answered individually by all the team members and their responses are as follows:

(a) Jason Tran

To successfully complete our project, I will need to learn more about backend and data migration. As I have more professional experience with the frontend or how to connect the front end to the backend, I will now need to learn the final step of creating the backend itself. This includes how to code with Python and how to create algorithms myself.

(b) Jennifer Ye

Although I have good skills in writing and team management, the one item that I will need to acquire in this capstone is my back-end knowledge. I know how back-end applications works with aspects like APIs and databases as a general concept, but I have no real experience with implementation. With this capstone project being an end-to-end project, with a focus on back end, I believe it will be critical for me to gain that knowledge to be an impactful team member to the project.

More specifically, I will need to acquire more advanced knowledge of databases and API creation. My strength is in mobile and web development, but since that portion of the project is in the later half of the project, I do not want to wait for then to be impactful. I would like to learn and practice the knowledge throughout the term.

(c) Kate Min

I will direct my focus towards machine learning algorithms and NoSQL databases. While I have experience with PostgreSQL, I'm not as familiar with NoSQL/MongoDB to make significant contributions at this time.

Developing a strong foundation in this area would allow me to contribute meaningfully to the backend development. I don't have much experience in machine learning, but this aspect will be essential to our application for data analysis. Successfully acquiring the knowledge needed in both areas will strengthen my ability to work on different parts of the project.

(d) Sumanya Gulati

Using version control conventions and such for a large-scale project. In the past, my use of git has been limited to just storing code in a centralized repository that my team members could access. We did not do any proper documentation or reviews.

This is the first project where our team has come up with a merging strategy, naming conventions and more to keep the git history clean and to ensure conformity and proper documentation. In terms of technology, I have never worked with NoSQL databases before so I am looking forward to exploring that!

6. **For each of the knowledge areas and skills identified in the previous question, what are at least two approaches to acquiring the knowledge or mastering the skill? Of the identified approaches, which will each team member pursue, and why did they make this choice?**

This question was answered individually by all the team members and their responses are as follows:

(a) Jason Tran

I will utilize two approaches on my learning experience, which is to explore resources online and jump straight into the deep end. This will apply what I have learned online in a real application which, in my experience, allows me to connect the dots a lot faster. Ultimately, jumping into the deep end will help progress the project along and create an iterative learning style.

(b) Jennifer Ye

One approach I will use to learn more about API and database creation is to follow tutorial crash courses. With this method, I can have a clearer fundamental understanding on the concepts. This might include parts like how they operate, simple manipulation and customization.

Another approach which can also serve as a follow up approach will be to use them in practice and to learn as I go. This can be in the form of a quick side project. I will be pursuing both as I deem it necessary to be able to succeed in gaining the knowledge in a valuable way. I think learning all the content/knowledge of the back-end from tutorials and cash courses might even be all I need to gain the knowledge and contribute to the project on that front.

However, with my learning style, I would do better if I also applied the things I learned. This can be done straight from the capstone project, or even having a small side project to just apply what I learned before going into the project is another possibility. In conclusion, I will be using the first method to gain the knowledge I need but will also do the second method due to my learning style.

(c) Kate Min

I don't expect the learning curve from Postgres to MongoDB to be too steep, so either an online course or doing a guided project would be ideal. I would go with the latter approach to gain the necessary knowledge/experience quickly, since we'll want to implement the database early on in the development process.

Both an online course or a small-scale project would give me a strong foundation in ML models. I'd prefer to take an online course as it would allow me to gain a deeper understanding and more experience over time. Since we'll likely focus on implementing the ML at a later time, it will be easier for me to grasp the core concepts and thus make significant contributions to its implementation.

(d) Sumanya Gulati

The two approaches to mastering git and NoSQL databases would be following a tutorial to learn how git works and basic commands; and, just practicing it for all deliverables and learning along the way.

I will be leveraging my existing knowledge of git commands and workflows and use it to learn how it can be adapted to large-scale, long-term projects that are maintainable and scalable. As for the NoSQL database, I would choose the former strategy and follow a guided tutorial first to familiarize myself with the topic so I can actually contribute to the project.
